

Far targets, biased geodesic base: auditing a regional landmark helps a little (~4-11%, significant) and persists with #targets — but fiber base (806-2485 km) is 4-10× better and needs no audit

A Audit gives a small but significant benefit (6 tgts/trial, 150 trials, 95% CI)

B E.Asia: audit persistently helps across 3-30 targets (no pooling collapse)
